

Fork Positioner for Forklifts

Forklift Fork Positioner - A fork positioner is an apparatus made out of high quality materials meant to be able to withstand the most difficult procedures and work environments. This particular piece of equipment can enable the one driving to maneuver the forks hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the arms or the entire load so as to facilitate much more exact lifting and position in a faster and more effective method.

The unique blade pocket design could enable the one operating it to safely sway the unit's forks without any fear of destroying the positioning cylinders. This could allow the worker the option to either execute independent or simultaneous fork movement, depending on the job requirement. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be converted into blade positioners on available units.
